

Math 250, Linear Algebra: Homework 5

Fall 2024

“The purpose of computing is insight, not numbers.” – Richard Hamming

Name:

Read the directions *very carefully* and then solve the problem, providing thorough details and steps. If you are not sure about what a particular symbol or word means, please ask me!

1. 2.1.1.
2. 2.1.9.
3. 2.1.25 (2.1.17 in 5E).
4. 2.2.9 (2.2.7 in 5E).
5. 2.2.11, 13, 15, 17, 19 (2.2.9 in 5E).
6. 2.2.23 (2.2.13 in 5E).
7. 2.2.31 (2.2.21 in 5E).

8. 2.3.11, 13, 15, 17, 19 (2.3.11 in 5E).
9. 3.1.5.
10. 3.1.13.
11. 3.1.20 (3.1.21 in 5E, somehow).

$$2.1.1 \quad -2 \begin{bmatrix} 2 & 0 & -1 \\ 4 & -3 & 2 \end{bmatrix} = \begin{bmatrix} -4 & 0 & 2 \\ -8 & 6 & -4 \end{bmatrix} = -2A \quad B-2A = \begin{bmatrix} 7 & -5 & 1 \\ 1 & -4 & -3 \end{bmatrix} - \begin{bmatrix} -4 & 0 & 2 \\ -8 & 6 & -4 \end{bmatrix} = \begin{bmatrix} 11 & -5 & -1 \\ 9 & -10 & 1 \end{bmatrix}$$

AC not possible because A has 3 columns while C has 2 rows. Number of columns in A must match the number of rows in C

$$CD = \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix} \begin{bmatrix} 3 & 5 \\ -1 & 4 \end{bmatrix} = \begin{bmatrix} 1 & 13 \\ -7 & -6 \end{bmatrix}$$

2.1.9 $AB = \begin{bmatrix} 23 & -10+5K \\ -9 & 15+K \end{bmatrix}$ $BA = \begin{bmatrix} 23 & 15 \\ 6-3K & 15+K \end{bmatrix}$ $\begin{matrix} -10+5K=15 & K=5 \\ -9=6-3K & -15=-2K & K=5 \end{matrix}$ $\begin{matrix} 15+K=15+K \\ K=5 \end{matrix}$ $AB=BA \text{ when } K=5$

$$\begin{bmatrix} 1 & -2 \\ -2 & 5 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -1 \\ 6 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -2 \\ -2 & 5 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 2 \\ -9 \end{bmatrix}$$

$$\begin{array}{rcl} 1x - 2y & = & -1 \quad x = 2y - 1 \\ -2x + 5y & = & 6 \quad -2(2y - 1) + 5y = 6 \\ & & -4y + 2 + 5y = 6 \\ & & -4y + 5y = 6 - 2 \\ & & y = 4 \\ & & x = 7 \end{array}$$

$$\begin{aligned} x + 2y &= 2 & x &= 2 + 2y \\ -2x + 5y &= 9 & -2(2 + 2y) + 5y &= 9 & x &= -8 \\ & & -4 - 4y + 5y &= 9 & & \\ & & -4 + y &= 9 & y &= 5 \end{aligned}$$

$$\begin{bmatrix} 7 \\ 4 \end{bmatrix} = \begin{matrix} \text{first column} \\ \text{of } b \end{matrix} \quad \begin{bmatrix} -8 \\ -5 \end{bmatrix} = \begin{matrix} \text{2nd column} \\ \text{of } b \end{matrix}$$

2.1.25

2.2.9 $A = \begin{bmatrix} 1 & 2 \\ 5 & 12 \end{bmatrix} \begin{matrix} \Delta & -b \\ -c & a \end{matrix} \begin{bmatrix} 12 & -2 \\ -5 & 1 \end{bmatrix}^{\frac{1}{2}} \det = 2 \quad A^{-1} = \begin{bmatrix} 6 & -1 \\ -\frac{5}{2} & \frac{1}{2} \end{bmatrix} \begin{pmatrix} 3 \\ 5 \end{pmatrix}$

a. $A^{-1} \times b_1 = \begin{bmatrix} -9 \\ 4 \end{bmatrix}$ $A^{-1} \times b_2 = \begin{bmatrix} 11 \\ -5 \end{bmatrix}$ $A^{-1} \times b_3 = \begin{bmatrix} 6 \\ -2 \end{bmatrix}$ $A^{-1} \times b_4 = \begin{bmatrix} 13 \\ -5 \end{bmatrix}$

$$\begin{bmatrix} 1 & 2 & -9 & 11 & 6 & 13 \\ 5 & 12 & 4 & -5 & -2 & -5 \end{bmatrix} \xrightarrow{R_2 - 5R_1} \begin{bmatrix} 1 & 2 & -9 & 11 & 6 & 13 \\ 0 & 2 & 4 & -5 & -2 & -5 \end{bmatrix} \xrightarrow{R_2/2} \begin{bmatrix} 1 & 2 & -9 & 11 & 6 & 13 \\ 0 & 1 & 2 & -5 & -2 & -5 \end{bmatrix} \xrightarrow{R_1 - 2R_2} \begin{bmatrix} 1 & 0 & -13 & 21 & 10 & 21 \\ 0 & 1 & 2 & -5 & -2 & -5 \end{bmatrix}$$

2.2.11, 13, 15, 17, 19

11. T, Invertible if there is an $n \times n$ matrix C such that $CA = I$ & $AC = I$

13. F, Inverse of $AB + (AB)^{-1}$ is $B^{-1}A^{-1}$

15. F_1 would have to be $ad-bc \neq 0$ for A to be invertible

17.7, $x = A^{-1}b$

19. T. Row operations are reversible, so elementary matrices are invertible

2.2.23 $AB=AC$ A is invertible $A^{-1}(AB) = A^{-1}(AC)$ $A^{-1}A(B) = A^{-1}A(C) \rightarrow I \cdot B = I \cdot C \quad B=C$
 $A^{-1}A = I$

Not generally true when A is not invertible

2.2.31) / linear independence is when the vectors cannot be written as scalars of each other

Linear independence is when the vectors cannot be written as scalar multiples of each other. For example, a 2×2 matrix has the determinant $ad-bc \neq 0$ if it is invertible, if $\neq 0$, you can find the inverse of the matrix.

For example, a 2×2 matrix has the determinant $ad-bc \neq 0$ if a, b, c, d are not linearly dependent. I believe the determinant determines if the Matrix is invertible, the determinant is only able to do that if vectors are linearly independent.

2.3.11, 13, 15, 17, 19

2.3.11, 13, 15, 17, 19
11. T, according to statements b & d in the invertible matrix theorem, All statements are equivalent

13. T, according to statements 11 & 12 in the
 is INT. INT only applies to $n \times n$ (square Matrices)

IS.T. statement 9 in IMT. IMT only applies

17. T, only when $Ax=0$ has the trivial solution, $x=0$.

3.1.5. $\begin{vmatrix} 2 & 3 & -3 \\ 4 & 0 & 3 \\ 6 & 1 & 5 \end{vmatrix}$ $A_{11} = \begin{bmatrix} 0 & 3 \\ 1 & 5 \end{bmatrix} \rightarrow A_{12} = \begin{bmatrix} 4 & 3 \\ 6 & 5 \end{bmatrix} \rightarrow A_{13} = \begin{bmatrix} 4 & 0 \\ 6 & 1 \end{bmatrix}$
 $0 \cdot 3 = 3 = \det(A_{11})$ $20 - 18 = 2 = \det(A_{12})$ $4 \cdot 0 = 4 = \det(A_{13})$
 $2(-3) - 3(2) + 3(4) = -6 - 6 + 12 = 0$ Matrix is invertible

3.1.13. $\begin{vmatrix} 4 & 0 & -7 & 3 & -5 \\ 0 & 0 & 2 & 0 & 0 \\ 7 & 3 & -6 & 4 & -8 \\ 5 & 0 & 5 & 2 & -3 \\ 0 & 0 & 9 & -1 & 2 \end{vmatrix}$ $A_{23} = \begin{bmatrix} 4 & 0 & 3 & -5 \\ 7 & 3 & 4 & -8 \\ 5 & 0 & 2 & -3 \\ 0 & 0 & -1 & 2 \end{bmatrix}$ $A_{22} = \begin{bmatrix} 4 & 3 & -5 \\ 5 & 2 & -3 \\ 0 & -1 & 2 \end{bmatrix}$ $A_{32} = \begin{bmatrix} 4 & -5 \\ 5 & -3 \end{bmatrix}$ $A_{33} = \begin{bmatrix} 4 & 3 \\ 5 & 2 \end{bmatrix}$
 $-2 \cdot \begin{vmatrix} 4 & 0 & 3 & -5 \\ 7 & 3 & 4 & -8 \\ 5 & 0 & 2 & -3 \\ 0 & 0 & -1 & 2 \end{vmatrix} = -2 \cdot \begin{vmatrix} 4 & 3 & -5 \\ 5 & 2 & -3 \\ 0 & -1 & 2 \end{vmatrix} = -2 \cdot \begin{vmatrix} 4 & -5 \\ 5 & -3 \end{vmatrix} = -2 \cdot (-12 - (-25)) = -2 \cdot 13 = -26$
 $-2 \cdot 3 \cdot -1 = 6$

3.1.20 $k \cdot R_2$
 $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \rightarrow \begin{bmatrix} a & b \\ kc & kd \end{bmatrix}$ Scales determinant by a factor of k
 $ad - bc$ $a(kd) - b(kc)$
 $k(ad) - k(bc)$
